IRRIGATION IN TEXAS IN 1958

INTRODUCTION

The lack of basic data relating to the amount of irrigation in Texas has been recognized for many years. After the passage of the Texas Water Planning Act of 1957 by the 55th Legislature creating the Planning Division within the Board of Water Engineers, there was increased concern that data were not available, except in the form of broad estimates, on the present extent of irrigated areas and amount of water consumed by irrigated crops. A proposal for a study to obtain authentic information on present irrigated acreage as well as on the inventory of additional acreage suitable for irrigation was expressed by the Texas State Soil Conservation Board, and a movement was begun in 1958 to conduct an irrigation survey jointly between the Soil Conservation Service, U. S. D. A.; the State Soil Conservation Board; and the Texas Board of Water Engineers.

Criteria and procedures for conducting an irrigation survey were developed cooperatively to secure the needed information through the Soil Conservation Service and Soil Conservation Districts. In 1958, Congress created the U. S. Study Commission - Texas to make a special study of water and related land resources and development in eight river basins and intervening areas extending from the Neches to the Nueces, covering approximately 62 per cent of the State. The Commission financed and utilized the Soil Conservation Service to secure for Commission work the field data covering the portion of the State within its study area. For the remaining area of the State, amounting to 38 per cent of the total area, the Soil Conservation Service furnished necessary funds and personnel to gather the field information. The Texas Board of Water Engineers provided drafting room services for the preparation of irrigation maps for each county, IBM data processing facilities, engineering assistance in the preparation of this report, and the printing of the report.

This survey inventories acreages and crops irrigated in 1958 together with the amounts of surface and underground water applied, the number of irrigation wells, and the acreages that are potentially suitable for irrigation if water was provided.

ACKNOWLEDGMENTS

All agencies and individuals who have participated either in the inception of this survey, in the preliminary planning of it, or in the collection of the basic data are commended for their contributions. Particular acknowledgment is made to the State Soil Conservation Board, Soil Conservation Service, and the United States Study Commission - Texas for their contributions in the planning, collecting, and in making the data available for publication. Acknowledgment is given to the following individuals who had a part in the inception, planning, and collection of data:

A. C. Spencer, Executive Director, State Soil Conservation Board, Temple, Texas.

H. N. Smith, State Conservationist; P. M. Price, State Conservation Engineer; and Clyde W. Graham, Assistant State Conservationist, Soil Conservation Service, Temple, Texas.

PERSONNEL

This report was prepared by Engineering Services, Board of Water Engineers, under the general supervision of John J. Vandertulip, Chief Engineer. Initial work was done by Robert V. Thurmond, Irrigation Engineer, under the general supervision of McDonald D. Weinert, former Chief Engineer.

The Planning Division under Dr. Karl F. Keeler, Chief Planning Engineer, and Garner E. Jones, Associate Planning Engineer, developed the text and coordinated the preparation of the final report with other departments and agencies.

The Data Processing Division directed by Ivan M. Stout, Head, transferred field survey data to IBM punch cards, made machine computations, and statistical interpretations of the data.

J. M. Norton, Water Planning Engineer, State Soil Conservation Board, Temple, Texas, furnished valuable guidance and assistance in the preparation of this report.

The collection of field survey data was under the general supervision of R. C. Barnes, Assistant State Conservation Engineer, Soil Conservation Service, Temple, Texas.

The survey was conducted in each county and soil conservation district under the direction of engineers, conservationists, and soil scientists of the Soil Conservation Service. Information was secured by field reconnaissance and from records of Soil Conservation Districts, Irrigation Districts, Water Conservation and Improvement Districts, Agricultural Stabilization Conservation Committees, Soil Conservation Service, and individual land owners. The data were reviewed with the County Conservation Needs Inventory Committee, the local Soil Conservation District Supervisors, the County Agricultural Agent of the Extension Service, and needed adjustments made.

FIELD SURVEY

Summary Description of Data

This survey secured and compiled data on the following items for the 1958 crop year:

- (1) Total acreage irrigated
- (2) Total acreage irrigated from surface water

- (3) Total acreage irrigated from underground water
- (4) Total acreage irrigated from combined supplies of surface and underground water
- (5) Number of acres irrigated by sprinkler irrigation
- (6) Number of sprinkler systems
- (7) Number of irrigation wells
- (8) Total acreage of dryland soils similar to those presently irrigated which could be irrigated if water was provided
- (9) Tabulation of crop acreage and amount of water applied on cotton, grain sorghum, field corn, sweet corn, wheat, oats, and barley, rice, forage sorghum, pastures, alfalfa, peanuts, citrus orchards, deciduous orchards, sweet potatoes, irish potatoes, and vegetable crops.

Total area of land previously irrigated but not in 1958 was also secured and compiled.

The field information was placed on county highway maps upon which the Texas Board of Water Engineers had delineated major river basin and sub-basin boundaries used in their report to the 56th Legislature.

Irrigated areas were delineated on the basis of the source of irrigation water showing separately surface water, underground water, or a combination of both. Within the delineated areas, the acreage of land that had been previously irrigated and acreage of land actually irrigated in 1958 were determined and shown. Areas of non-irrigated dryland soils, which would be suitable for irrigation if a water supply was provided, also were delineated and the acreage tabulated.

Determination of Areas

Detailed and generalized soils maps showing types of soils and related data as well as records in the local offices of the Soil Conservation Service and other agricultural agencies were used to the fullest extent in locating areas of irrigation and the crops grown during the 1958 crop year. Such other agencies and sources of information included Soil Conservation Districts, Irrigation Districts, Water Control and Improvement Districts, Irrigation Canal Companies, and individual irrigators.

Irrigated lands were delineated on county maps from the field reconnaissance. In preparing these maps, use was made of available records and the technician's knowledge of the area. Major river basin, sub-basin, and soil conservation district boundaries were shown on the maps. Areas irrigated from surface-water supplies, ground-water supplies, and combined supplies of underground water and surface water were delineated. The irrigated areas within each delineation were determined by planimeter, or from official records, and the acreages tabulated. Acreages of the major crops irrigated in 1958 were also determined and tabulated. Where combined supplies were shown, the percentage of surface water was obtained in each area.

The county maps were not included in this report because of the large number of maps involved (285) and the expense of drafting and reproduction. Sets of these county maps showing the field survey data are on file in the various offices of the agencies who participated in the survey and are available for examination.

Irrigated Areas by Crops

Information as to acreages of the seventeen major crops grown in 1958 was gathered and tabulated. Records of all agricultural agencies were used to obtain the data. Field reconnaissance and consultation with irrigators and representatives of state and federal agencies were used to complete the survey.

Estimates of Amounts of Irrigation Water Used

An estimate of the amount of irrigation water applied in 1958 for the various crops was made from local studies and records of on-farm application of water. The water applied was considered as that amount which the farmer applied to supplement effective precipitation. Records of all appropriate agencies, and records of individual irrigators and canal companies provided the basis for the estimates.

Determination of Lands Previously Irrigated

Land that had previously been irrigated and which presently has irrigation facilities to serve it was delineated separately on the county maps, and such acreage within the delineated area was determined, and a tabulation made. Field reconnaissance and records of all agencies provided a basis for these estimates.

Determination of Potentially Irrigable Lands

Areas of non-irrigated land with similar soils and topography to those presently irrigated, which would be suitable for irrigation if a water supply was provided were delineated on the maps and the acreages determined. For areas having little or no irrigated land in the vicinity, the following criteria were used to show the lands suitable for irrigation: those with deep, fertile soils having flat slopes which do not ordinarily exceed one per cent, and having an intake rate and water storage capacity in the root zone favorable for irrigation. Detailed and generalized soil maps were used to delineate these areas of potential irrigation. The delineations were made by field reconnaissance and the technician's knowledge of the areas involved.

RESULTS OF THE SURVEY

The basic data such as shown in table 1 were transferred to IBM punch cards by the Data Processing Division of the Board of Water Engineers. Listings from the punch cards were made by county, by soil conservation district, and by sub-basin to show values for the following items:

Total acreage irrigated
Total acre-feet of water applied
Total acreage irrigated from surface water only
Total acre-feet of water applied
Total acreage irrigated from underground water only
Total acre-feet of water applied
Total acreage irrigated from combined supplies (surface and
underground water)
Total acre-feet of water applied
Per cent of surface water only from combined supplies
Total acreage previously irrigated but not in 1958
Total acreage of non-irrigated similar soils
Total number of irrigation wells
Acreages of major crops and amount of irrigation water applied

The items shown above were summarized as given in the following tables:

Table 2 - Irrigation Summary, By Counties

Table 3 - Irrigation Summary, By Soil Conservation Districts

Table 4 - Irrigation Summary, By River Basins

Table 6 - Irrigation Summary of Crops, By Counties

The summary of the irrigation water applied is shown in table 5, which contains the percentages and amounts of surface water and underground water used in each river basin and coastal area.

A summary of the acreages of the major crops and the amount of water used by each is shown by counties in table 7.

River basins and coastal areas of the State are shown on plate 1, and soil conservation districts and State zones are shown on plate 2.

SUMMARY

This survey shows that in the State of Texas for the year 1958, 1,126,579 acres were irrigated from surface water only, 5,401,786 acres from underground water only, and 209,520 acres from combined supplies of surface and underground water. This gives an over-all total of 6,737,885 acres. An additional 2,414,143 acres of land previously irrigated and having irrigation facilities to serve it were not irrigated in 1958.

The water used on farms for irrigation in 1958 amounted to 2,170,212 acre-feet from surface water only, 6,947,262 acre-feet from underground water only, and 488,719 acre-feet from combined supplies of surface and underground water. Of the combined supplies 345,455 acre-feet was supplied from surface water, and 143,264 acre-feet was supplied from underground water. Therefore, surface water supplied 2,515,667 acre-feet, or 26 per cent, and underground water 7,090,526 acre-feet, or 74 per cent, of the over-all total of 9,606,193 acre-feet of irrigation water applied in Texas in 1958 from both sources.

The depth of irrigation water applied ranged from 0.4 foot in the Cypress River basin to 3.0 feet in the Lavaca River basin; the average was 1.4 feet for the State. The Brazos River basin showed the greatest amount of water used and the largest acreage irrigated; 2,653,657 acres irrigated, and 3,016,037 acre-feet of water used, an average depth of 1.1 feet.

Cotton, grain sorghum, wheat, rice, and vegetables had the largest areas and the greatest volume of water applied of the seventeen crops surveyed. The largest acreage of a single crop was cotton, and the greatest amount of water was applied on it: 2,778,505 acre-feet of water on 2,038,832 acres with an average depth of 1.4 feet. There were 2,114,947 acres of grain sorghum with 2,416,283 acre-feet of water applied for an average depth of 1.1 feet; 717,722 acres of wheat with 665,986 acre-feet of water applied for an average depth of 0.9 foot; 423,487 acres of rice with 1,323,563 acre-feet of water applied for an average depth of 3.1 feet; and 466,752 acres of vegetables with 829,492 acre-feet of water applied for an average depth of 1.8 feet.

There was double cropping of vegetable crops with other crops on 189,934 acres in the State; 103,312 acres where surface water only was used, 61,807 acres where underground water was used, and 24,815 acres where combined supplies of surface and underground water was used.

For cotton, where water was supplied from surface or underground water only, there was an average depth of 1.3 feet applied. For grain sorghum, an average depth of 0.6 foot was applied where surface water only was used, and 1.2 feet depth, where underground water only was used. Average rates for various crops can be determined for each county from the data contained in this report.

There were 55,540 irrigation wells enumerated, of which 45,363 irrigation wells were in 42 counties covering the north and south High Plains.

Some amount of irrigation was shown in 225 counties; with the area varying from two acres in Camp County to 537,513 acres in Hale County.

There were 25,049,396 acres of non-irrigated land similar to those presently irrigated from the standpoint of soils and topography that would be suitable for irrigation if water was provided.

COMPARISONS WITH THE PAST

Irrigation in the State has experienced a phenomenal growth in recent years. This survey and the United States Census of Agriculture shows areas irrigated in Texas have increased from 1,045,224 acres in 1939 to 3,131,530 acres in 1949, and then to 6,737,885 acres in 1958. Tabulations of the acreages irrigated for these years are shown by counties in table 8. Earlier periods show less expansion, increasing from 586,120 acres in 1919 to 798,917 acres in 1929. Increases

in acreage of irrigation have been supplied principally by ground water. In 1939, where underground water only was used, it supplied approximately 267,000 acres; in 1949, approximately 1,860,000 acres; and in 1958, approximately 5,402,000 acres.

Irrigation Survey - Cameron County

Information for this survey was secured from the Irrigation Districts in Cameron County, Extension Service, ASC County committee, Conservation Needs Committee for Cameron County, Board of Supervisors of the Southmost Soil Conservation District and from records and knowledge of Soil Conservation Service Technicians.

It is estimated that the survey is 5%.

Rainfall was below normal during the summer growing season requiring above normal irrigation. During the fall and winter months rainfall was above normal requiring only a small amount of irrigation. Over-all rainfall for County was approximately 25 inches. County Average "5"

*Double cropping was practiced on cotton and grain sorghums land.
