RECEIVED
DEC 27 2007
TWDB CONTRACT ADMIN DIV.

Summary

The Texas State Soil and Water Conservation Board (TSSWCB) has fully implemented all provisions of the Agricultural Water Conservation Grant Contract awarded by the Texas Water Development Board (TWDB). The grant award of \$100,000 supplemented \$100,000 in technical assistance funding allocated to local Soil and Water Conservation Districts (SWCDs) from the TSSWCB for support of planning and implementing agricultural water conserving Best Management Practices (BMPs) on farms and ranches. Eligible BMPs were those that directly or indirectly produced water savings and those that reduced erosion, a cause of increased sedimentation of Texas' surface water reservoirs.

A total of 199 SWCDs statewide were eligible and willing to participate in this program. The assistance performed by these SWCDs has resulted in an estimated **475,474 ac-ft potential water savings for the State** or approximately **4.75 ac-ft of water conserved for each grant dollar spent**. The potential savings is equivalent to 4.60% of the 2010 estimated statewide irrigation water use of 10,345,131 ac-ft.

Introduction

SWCDs provide technical and planning assistance to agricultural producers for implementing conservation BMPs on their farms and ranches. The Texas State Soil and Water Conservation Board (TSSWCB) received an Agricultural Water Conservation Grant of \$100,000 from the Texas Water Development Board (TWDB) for FY2007. The funds from the grant were allotted to eligible SWCDs to support providing technical assistance in planning agricultural water conserving BMPs on farms and ranches. Eligible practices were those that directly or indirectly produced water savings and those that reduced erosion, since erosion results in sedimentation of Texas' surface water reservoirs.

Methods

SWCD Eligibility Criteria

In order for a SWCD to be eligible to participate in the grant program, it had to satisfy at least one of four criteria. The four criteria were:

1. Water Needs

This is a criterion from TWDB based on county data in the 2007 State water plan (Water for Texas 2007). Water needs are the difference between projected water demands and available water supplies. Water needs are classified in several categories: municipal, irrigation, manufacturing, etc. Needs were projected in ten-year increments through 2060. County based data for all water needs for the 2060 projection were used. The county data were converted to a GIS layer which was then used to select the SWCDs that contained the counties with projected water needs.

2. Irrigation Conservation Strategies

This is also a criterion from TWDB. In developing the 2007 regional water plans, the planning regions that projected water needs were requested to identify strategies for meeting their water needs. Several planning regions identified irrigation conservation as one of their strategies for meeting their water needs. Data from TWDB for those counties that identified irrigation water conservation strategies was converted to a GIS layer that was used to select the SWCDs that contained the counties with identified irrigation conservation strategies.

3. Principal Irrigation Areas

This is a criterion from the previous TSSWCB Subchapter H water conservation program. Data were originally from earlier Texas water plans in which TWDB had delineated "principal irrigation areas."

4. Sedimentation

This criterion is also from the previous TSSWCB Subchapter H water conservation program. It was based on sediment rates to major reservoirs. Sedimentation contributes significantly to surface water storage capacity loss in Texas. The 2007 state water plan states “Texas’ major reservoirs are losing approximately 90,000 acre-feet of storage per year due to sedimentation. This equates to a loss of roughly 0.27 percent of the total major reservoir capacity per year, or approximately 13 percent over the 50-year planning horizon.”

The eligibility of SWCDs under each of the criteria was established. The State Board determined that funding would be allocated equally to each criterion in each eligible district that was interested in participating in the program. Districts were surveyed to determine their willingness to participate in the program. 212 SWCDs met one or more eligibility criteria. Of those, 199 elected to participate in the program. Each participating district received an allotment of \$211.42 for each eligibility criterion that it met. For example, a district meeting three criteria received \$634.26.

Figure 1 shows the participating districts.

Appendix I contains a table showing the districts, their eligibility criteria, and their allocations.

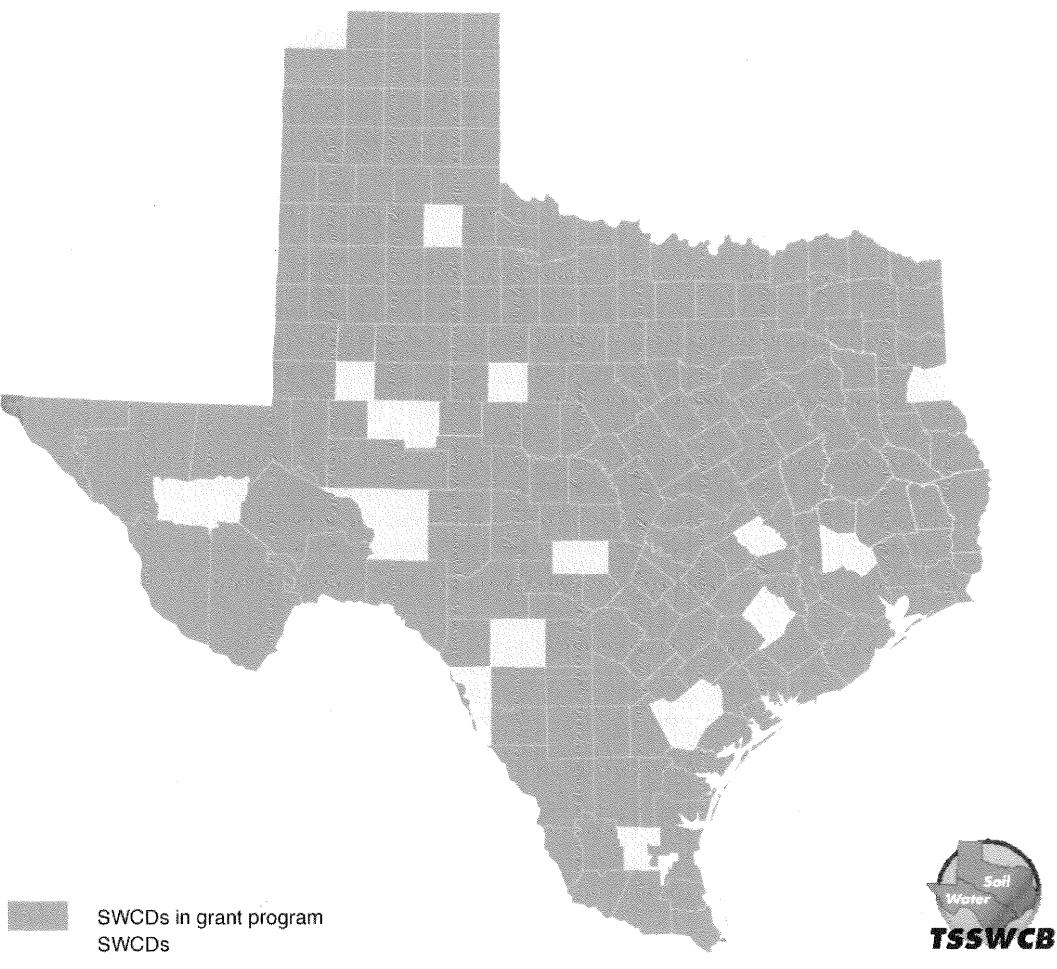

Figure 1. SWCDs Eligible and Participating in the FY 07 Ag Water Conservation Grant.

Eligible Practices

Eligible practices for the grant were agricultural water conservation BMPs developed by the water conservation task force (established by the 78th Texas Legislature) and other USDA-NRCS conservation practices that have the potential to save water. Water conserving potential was determined from *Texas Conservation Practices Physical Effects, USDA-NRCS Field Office Tech Guide, Section V*.

Erosion control practices were also deemed eligible based on their effects, also determined from *Texas Conservation Practices Physical Effects, USDA-NRCS Field Office Tech Guide, Section V*.

Water Savings Estimation

Water savings were estimated for those practices where data were available. Most estimates were from the agricultural water conservation BMPs developed by the water conservation task force. In general, the values reported are average values across the State. Where a range of values was presented, the average of the two endpoints of the range was used. Appendix II has detailed information on the source of the water savings estimates.

Estimates of water conservation were not available for many of the practices that have an indirect effect on water conservation, as the erosion BMPs. The water conservation amount for these practices was assumed to be zero for purposes of this estimate. Hence, the estimate for this grant is conservative.

Reporting

Each SWCD participating in the grant was required to report the eligible BMPs that were planned over the duration of the project. It was decided to report on the planned, rather than implemented BMPs because with conservation planning, landowners often have several years to implement the planned BMPs, depending on the requirements of the program under which the planning was done.

Results

A total of 199 out of 217 SWCDs participated in the grant program. Potential water savings resulting from this grant was estimated at 475,474 ac-ft. The potential savings is equivalent to 4.60% of the 2010 estimated statewide irrigation water use of 10,345,131 ac-ft. Approximately 4.75 ac-ft of water was conserved for each grant dollar spent. Potential water savings resulting from technical assistance from this grant are shown in Table 1. Individual SWCD water savings results can be found in Appendix III.

The practice yielding the largest potential water savings was crop residue management and conservation tillage with 475,284 acres planned for an estimated water savings of 190,114 ac ft. The second highest water saving practice was brush control/management with 416,449 acres planned for an estimated water savings of 187,402 ac-ft.

Twenty water-conserving BMPs were used by SWCDs in planning, and twenty-three erosion control BMPs. It should be noted that some of the BMPs do not directly prevent erosion, but are part of a system. For example, prescribed grazing, a grazing management system, includes cross fencing and watering facilities so that livestock may be rotated among smaller pastures, thus preventing overgrazing and subsequent erosion.

Table I. Potential Water Savings from Planned BMPs.

Conclusion

This grant resulted in the planning of agricultural water conservation and erosion control BMPs across the State of Texas. The estimate water savings from this grant is 475,474 ac-ft. The potential savings is equivalent to 4.60% of the 2010 estimated statewide irrigation water use of 10,345,131 ac-ft.

Approximately 4.75 ac-ft of water was conserved for each grant dollar spent. All funds were administered by SWCDs in a highly effective and efficient manner necessary for providing local assistance to farmers and ranchers in the planning and implementation of water conservation BMPs.
