# WATER-LEVEL DATA FROM OBSERVATION WELLS IN THE SOUTHERN HIGH PLAINS OF TEXAS, 1965-70

## INTRODUCTION

This report has been prepared to update the previously published Texas Water Development Board Report 21, *Water-Level Data From Observation Wells in the Southern High Plains of Texas*.<sup>1</sup> April 1966. Together, the two volumes reflect the entire historical period of water-level observation to February 1970.

Changes in ground-water conditions in the Southern High Plains of Texas are of major concern to the ground-water user and to all others who are affected by the economy generated by the use of ground water in this area. The Texas Water Development Board receives hundreds of requests annually for water-level data for the area from individuals, municipal governments, industries and small businesses which are affected by the declining ground-water levels.

Water-level records from approximately 1,500 wells which are located in 32 counties in the Southern High Plains of Texas are presented in this report. Since Report 21 was published in 1966, an observation well network has been established in Borden, Garza, and Howard Counties. Records of water-level measurements from the wells in these counties are included in this report.

The water-level measurements published in this report are mostly from wells which penetrate only the Ogallala Formation. In the southernmost part of the area, some wells also penetrate a thin layer of cretaceous age rocks which underlie the Ogallala. However, the Ogallala and Cretaceous rocks are generally considered to be hydrologically interconnected in this area and contribution from the Cretaceous strata is considered to be minor.

The Ogallala Formation, the major aquifer underlying the Southern High Plains, varies in total thickness from a few feet to more than 500 feet in the approximately 31,000 square miles covered by this

report. A large upper part of this formation, however, is not saturated with water. The saturated thickness of the formation varies from less than 20 feet to more than 300 feet.

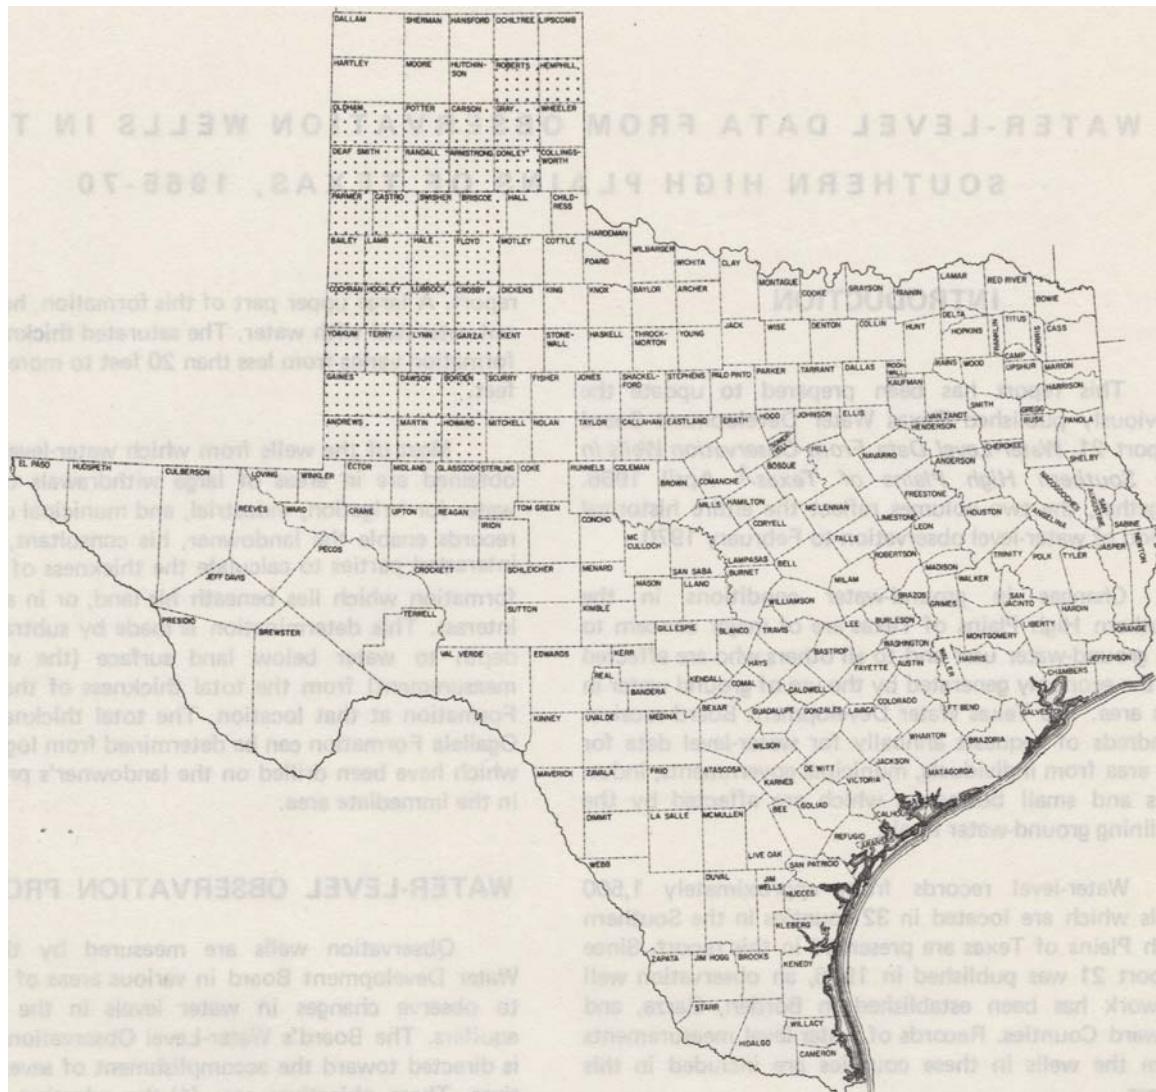

Most of the wells from which water-level data are obtained are in areas of large withdrawals of ground water for irrigation, industrial, and municipal use. These records enable the landowner, his consultant, or other interested parties to calculate the thickness of saturated formation which lies beneath his land, or in an area of interest. This determination is made by subtracting the depth to water below land surface (the water-level measurement) from the total thickness of the Ogallala Formation at that location. The total thickness of the Ogallala Formation can be determined from logs of wells which have been drilled on the landowner's property or in the immediate area.

## WATER-LEVEL OBSERVATION PROGRAM

Observation wells are measured by the Texas Water Development Board in various areas of the State to observe changes in water levels in the principal aquifers. The Board's Water-Level Observation Program is directed toward the accomplishment of several objectives. These objectives are: (1) the selection, in every major aquifer, of a network of wells that are spaced to afford adequate data for preparation of piezometric maps or water-table contour maps referenced to sea-level datum; (2) annual or periodic measurement of water levels in each well in this network made at the time of year when water levels have recovered from the effect of pumping during the season of peak water demand; (3) the operation of continuous water-stage recorders in representative wells where a continuous record of water-level changes is needed; (4) preparation of maps and graphs that show the fluctuation of water levels as revealed by water-level measurement; and (5) publication of water-level information and the evaluation of the data.

The Water-Level Observation Program of the Texas Water Development Board is conducted by personnel of the Ground Water Division, a Board technical service division, under the general direction of C.R. Baskin,

<sup>1</sup> A limited number of copies of Report 21 are currently available for distribution upon request to the Texas Water Development Board, P.O. Box 13087, Austin, Texas 78711.

**Map of Texas Showing Area Covered by This Report**

Chief Engineer, and Richard Peckham, Director of the Ground Water Division. This report was prepared under the supervision of Bernard B. Baker, Assistant Director in charge of Availability Programs, and A. Wayne Wyatt, Head of the Water Levels Section. Tabulations of the water-level data contained in this report were prepared by the Board's Electronic Data Processing Division under the direction of Mike Parker, Director, Bill Treacy, Commercial Systems Section Head, and Walter Gersch, Programmer.

Members of the Water Levels Section are: Charles Cornelis, Hershel Davidson, Charles Ferguson, Steve Moore, Herbert Spradlin, and A. Wayne Wyatt.

## FLUCTUATIONS OF WATER LEVELS

In the Southern High Plains the principal long-term changes in water levels have reflected decreases in the overall volume of water stored in the aquifer. When pumping exceeds recharge, which is quite small in this region, some of the water discharged from the aquifer must be withdrawn from storage, and water levels decline.

When a water well is pumped, the water table in the vicinity of the well is drawn down in the shape of an inverted cone with its apex at the pumped well. This cone is commonly referred to as the cone of depression. The development or growth of this cone depends on the physical and hydraulic characteristics of the aquifer, and on the rate of pumping.

Where extensive development takes place in an aquifer, each well superimposes its individual cone of depression on the cones of neighboring wells. This results in the development of a regional cone of depression. When the cone of one well overlaps the cone of another, interference occurs and an additional lowering of water levels takes place as the wells compete for water. The amount or extent of interference between these cones of depression depends on the rate of pumping from each well, the spacing between wells, and the physical and hydraulic characteristics of the aquifer.

The excessive decline of water levels is a principal cause of increased pumping cost, decreased well yields, abandonment of shallower wells, and in some areas an undesirable change in water quality due to salt-water encroachment.

## METHODS OF COLLECTING WATER-LEVEL DATA

Water levels in most of the observation wells are measured on an annual basis. If possible, wells selected for annual observation purposes should not be equipped with a pump and should be located a reasonable distance from heavily pumped wells. However, in areas of intense ground-water development, such as the Southern High Plains area, usually the only wells available for measurements are equipped with large-capacity turbine pumps. It is then necessary to measure the water levels in these wells after allowing sufficient time following cessation of pumping for water levels to recover to a level representative of the general area. In irrigated areas it is most desirable to measure water levels during the winter months when pumping is at a minimum or nonexistent and water levels have recovered to their highest level.

Water levels are reported as depth to water below land surface. This depth is obtained by measuring the distance from a permanent measuring point near the land surface to the water level in the well, and then subtracting the vertical distance between the measuring point and the land surface. Water-level measurements in the Southern High Plains are obtained by one of the following methods:

### (1) Wetted Steel Tape Method

A calibrated steel tape is lowered into the well until a portion of the lower end of the tape is submerged in the water. The depth to water below the well's measuring point is obtained by subtracting the wetted portion of the lower end from the footmark held at the well's measuring point.

Water levels measured with a steel tape are recorded in the Texas Water Development Board's records to the nearest hundredth of a foot. The wetted steel tape method for obtaining water-level measurements is considered the most accurate, and is the

method commonly used by Texas Water Development Board personnel.

### (2) Electric-Line Method

The electric line measuring device consists of a hand-operated reel, a current meter, a dry-cell battery for power, and a length of double-conductor insulated wire with electrodes at the lower end. The electric line operates on the principle of a completed electric circuit; when the electrodes on the end of the electric line contact the water surface in the well, the electric circuit is completed and is indicated on the current meter at land surface. Calibrated markings on the electric line provide a means for direct reading of the water level. The electric-line method is used where water-level measurements are unobtainable with a steel tape, such as in wells having leaky casing.

Water-level measurements obtained by this method are recorded in the Texas Water Development Board's records to the nearest tenth of a foot.

### (3) Automatic Recorder Method

An automatic water-level recorder consists of a float suspended by a metal tape or cable from a recording instrument installed over the well. As the float rises and falls with the water surface in the well, the motion is transferred to a pen which graphs the fluctuation on a clock-driven chart. The continuous recording of water levels in a well affords the best means for observing rapid and irregular water-level fluctuations in areas of large ground-water development.

Recorders are visited at frequent intervals for maintenance, accuracy checks, and collection of the water-level charts. Water-level readings taken from the charts are tabulated in the Texas Water Development Board's records to the nearest hundredth of a foot.

## PRESENTATION OF DATA

For each observation well in the Texas Water Development Board's Water Level Observation Program, the water-level measurement, date of measurement, pertinent remarks, and initials of the person taking the measurement are recorded in the field on standard forms. The field data are later transferred to punch cards which enable the water-level measurements to be statistically analyzed and the results printed in a concise tabular form by the use of computers and other data processors.

Tabulated in this report are records of water levels from observation wells for 32 counties of the Southern High Plains. These listings provide the following information: well number, depth of well, elevation of land surface in feet above mean sea level, dates of measurement, measurements of water level in feet below land

surface, and changes (decline or rise) in water level from the previous year's measurement. These tables are reproduced from direct printouts of electronic data processing equipment.

Preceding the table for each county is a well-location map. A well symbol and the last three digits of the well number appear on the map at the location of each well listed in the county tabulation.

Hydrographs, showing changes in water level, are presented for selected representative wells following the respective county tabulations. The wells for which hydrographs have been prepared are indicated on the maps by a line beneath the well number.

These hydrographs show the entire water-level observation record, including the data tabulated in this report and data from Report 21. The water levels tabulated in this report are only those from January 1965 through February 1970.

Water-level measurements are presented in this report for many wells which have been lost to the program during the 5-year period. Most of these wells have been abandoned and destroyed, some have had equipment changes which make it impossible to enter the well with a measuring device, and others have been lost to the program for various other reasons.

## WELL-NUMBERING SYSTEM

To facilitate the location of wells and to avoid duplication of well numbers in present and future studies, the Texas Water Development Board has adopted a statewide well-numbering system. This system is based on division of the State into a grid of 1-degree quadrangles formed by degrees of latitude and longitude,

and the repeated division of these quadrangles into smaller ones as shown in the following diagram.

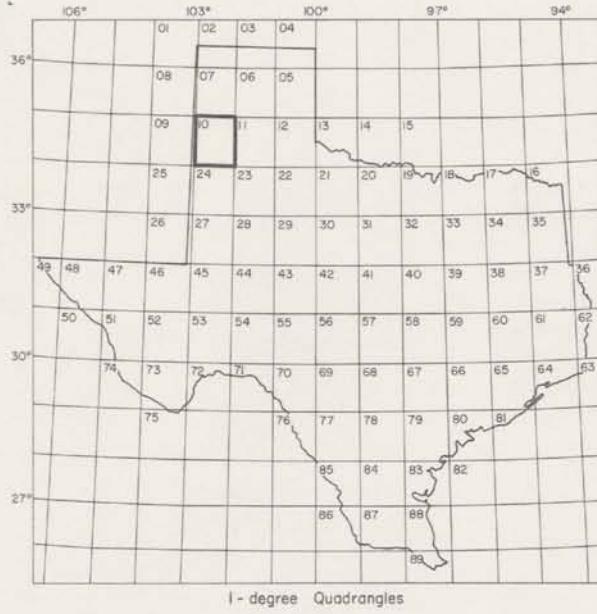

Each 1-degree quadrangle is divided into sixty-four 7½ minute quadrangles, each of which is further divided into nine 2½ minute quadrangles. Each 1-degree quadrangle in the State has been assigned an identification number. The sixty-four 7½-minute quadrangles are numbered consecutively from left to right, beginning in the upper left-hand corner of the 1-degree quadrangle, and the nine 2½-minute quadrangles within each 7½-minute quadrangle are similarly numbered. The first 2 digits of a well number identify the 1-degree quadrangle; the 3rd and 4th, the 7½-minute quadrangle; the 5th digit identifies the 2½-minute quadrangle; and the last 2 digits identify the well within the 2½-minute quadrangle.

On the well-location maps in this report, the 1-degree grid lines are identified with large open-block numerals, and the 7½-minute quadrangles are numbered in their northwest corners. The 3-digit number shown with the well symbol contains the number of the 2½-minute quadrangle in which the well is located and the number of the well within that quadrangle.

## ACKNOWLEDGEMENTS

Special appreciation is expressed to the many landowners in the area covered by this report for their interest and cooperation in allowing their wells to be measured in the Board's Water-Level Observation Program.

Each year, the High Plains Underground Water Conservation District No. 1 and the Panhandle Ground Water Conservation District No. 3 have cooperated with and assisted the Texas Water Development Board staff by measuring about one-half of the observation wells in their respective districts. The assistance of these districts and of their staff members is gratefully acknowledged.
