## **Summary**

Land irrigated in Texas in 2000 was 6.35 million acres with a total of 9.76 million acre-feet of on-farm use of water. "Surveys of Irrigation in Texas, 1958, 1964, 1969, 1974, 1979, 1984, 1989, 1994, and 2000" is based on cooperative surveys by the Texas Water Development Board, the U.S. Department of Agriculture's Natural Resources Conservation Service, and the Texas State Soil and Water Conservation Board. Information provided includes irrigated acreage and crops, water use, sprinkler irrigation acreage, irrigation operations, and irrigation conservation practices.

In much of Texas, irrigation water prevalently is applied in climatic provinces where lack of natural rainfall may contribute significantly to the soil moisture condition. The amounts of water consequently used for irrigation fluctuates from year to year with changes in climatic conditions and the amount of acres irrigated.

Comparisons of leading irrigated crops in 2000 with 1994 were cotton – 2,432,121 to 2,209,639 acres; corn – 996,070 to 1,070,209 acres; wheat – 992,125 to 1,048,988; and grain sorghum – 326,515 to 595,682 acres respectfully.

Irrigation wells continued to increase in number, even though some of the older wells have been abandoned. There were 115,857 irrigation wells in Texas in 2000. In the 2000 survey, ground water from these wells constitutes 81 percent of the total on-farm use for irrigation in the State, while 19 percent is supplied from surface water.

## **Irrigation Development in Texas**

The census for the crop year of 1889 reported that Texas had over 18,000 acres irrigated on 623 farms. By 1899, the area irrigated approached 50,000 acres on 1,325 farms. Comparatively rapid development occurred during the period 1900-09. The area irrigated in 1909 was about 451,000 acres. Development was much slower from 1910 to 1929 when about 594,000 acres was irrigated. Irrigated acreage increased by about 300,000 acres during the next 10 years. The census of 1939 reported that Texas had nearly 895,000 acres irrigated. Particularly rapid irrigation development followed the end of World War II. The 1949 Census of Agriculture reported 3.1 million acres irrigated, and the 1958 Irrigation Survey showed 6.7 million acres irrigated. Subsequent surveys reported 7.7 million acres in 1964; 8.2 million acres in 1969; 8.6 million acres in 1974; 7.8 million acres in 1979; 6.7 million acres in 1984; and 6.1 million acres in 1989. By 1994, the area irrigated in the State was 6.3 million acres. The 2000 Irrigation Survey reports 6.4 million acres (fig.1).

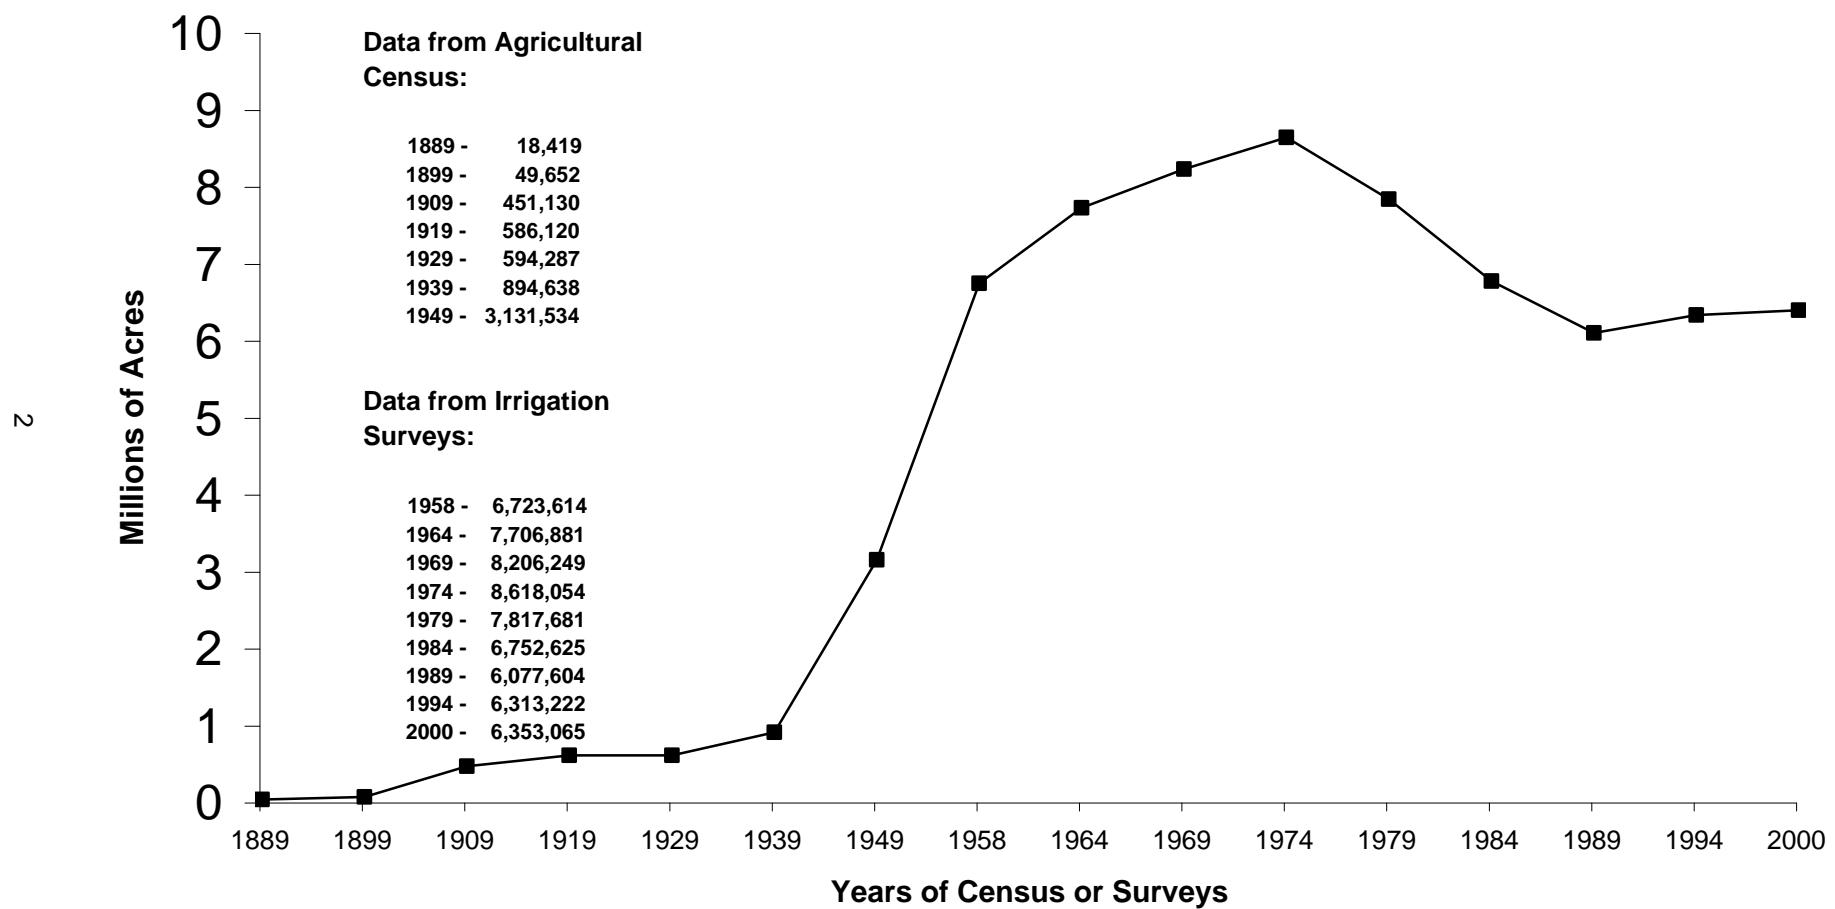

The history of irrigation in Texas has recorded some failures because of inadequate water supply, poor water quality, poor soil conditions, inadequate irrigation systems, or inefficient water management. On the other hand, successful irrigation enterprises have been developed in every area of the State, including the eastern-humid areas.

The vast majority of the 1,239,666 acre increase in sprinkler application is from "LEPA" (Low Energy Precision Application and "LESA" (Low Energy Spray Application) whereas irrigators can apply measured amounts of water that correspond to the soils' moisture holding capacity and evapotranspiration rates as well as increases the distribution or pattern efficiencies.

Drip or trickle irrigation which allows for precise amounts of water and nutrients to be delivered to the plant's root zone and thus eliminates all evaporation, increased by 25,331 acres from 51,529 in 1994 to 76,860 acres in 2000.

Figure 1

## TEXAS IRRIGATION DEVELOPMENT - 1889 - 2000

## **2000 Survey Procedures**

Survey forms and the field data gathering, recording and computational procedures were jointly developed by the cooperating agencies. The Natural Resources Conservation Service collected the basic data, using state office staff to provide statewide leadership and area engineers to provide local leadership. District and Resource Conservationists and Water Management Engineers and their staffs at the field office level, thoroughly familiar with irrigation and the land and water resources of their respective areas, did much of the detailed work. The Texas Water Development Board processed the maps and data sheets and compiled and published the report.

County highway maps were used to record much of the survey information. Data recorded on the maps were subsequently used to prepare summary tabulations of irrigation acreage by River and Coastal Basins and Zones, Soil and Water Conservation Districts, and Counties.

Other data, including irrigated acreage and water use for each irrigated crop type, were recorded in standardized forms on a countywide basis. The amounts of water used countywide were prorated among Soil and Water Conservation Districts, and among River and Coastal Basins and Zones according to the proportionate acreage irrigated from a given source of water supply that was located in each area segment.

## **Presentation of Data**

### **Irrigated acreage and water use (Tables 1, 2, 3)**

Summary survey data are contained in Table 1 for Counties, in Table 2 for River and Coastal Basins and Zones, and in Table 3 for Soil and Water Conservation Districts. These tables each list the total irrigated acreage, the acreage irrigated by each source of water that was used, estimated amount of water from each source of water used, and the percentage of the combined supply source of water used that was surface water. Shown also is the acreage irrigated by sprinkler systems. Table 1 additionally shows the estimated number of irrigation wells in each county with wells considered to be operable, but not necessarily used during the given survey year. Table 1 provides data from all nine surveys from 1958 to 2000; Table 2 provides data for 2000; Table 3 provides data for 2000.

A brief discussion on individual columns of Tables 1, 2, and 3 is warranted to prevent misapplication of the data: *All Irrigation* includes the total acreage irrigated and the total acre-feet of water applied on-farm on that acreage, regardless of the amount of double cropping (if any) and regardless of source of water use. Amounts of water applied do not include all transmission losses, but only the amounts of ground water pumped and transmitted to irrigated fields and the amounts of surface water transmitted to fields from farm headgates (on-farm use). Estimates of initial surface water diversions will, in most cases be larger than the survey estimates of on-farm use of surface water.

*Surface-Water Irrigation Only* includes that portion of the acreage and acre-feet of water applied for *All Irrigation* that was supplied from *only* surface-water sources, measured from the farm headgate, not the points of diversion.

*Ground-Water Irrigation Only* includes that portion of the acreage and acre-feet of water applied for *All Irrigation* that was supplied from *only* ground-water sources.

*Irrigation Using Combined Supplies* includes that portion of the acreage of *All Irrigation* where both surface and ground water sources were used on the same acreage or where surface and ground-water supplied irrigation was so intermingled that it was impractical to outline the areas where each was used. The part of the combined supply used that was surface water is shown as a percentage.

*Irrigation Wells* is the estimated total number of operable wells in the county at the time of the survey.

*Sprinkler Systems* gives the estimated number of acres irrigated with sprinkler irrigation systems during the survey years.

#### **Crop Data (Table 4)**

Table 4 provides estimated irrigated crop acreage for the State for the period 1974 – 2000. Irrigated crop acreage sometimes exceed irrigated acreage shown in Table 1 because two or more irrigated crops were growing during the same year on the same surface acre (double cropping). Skip-row planted crop acreage have been converted to equivalent solid-planted acreage. Detailed irrigated crop acreage by county are available upon request.

#### **Miscellaneous Countywide Data (Table 5)**

Table 5 provides miscellaneous county-wide data for 2000. Survey items having significance to the current status of Texas irrigation have been tabulated.

An irrigated operating unit reflects the acreage under the control of an individual operator as being an operating unit regardless of the number or location of the parcels of land that the producer operated.

The number of acres served by trickle irrigation systems is shown for each county. Trickle irrigation systems can be installed on the soil surface, beneath the soil, or a combination of both.

Table 5 includes the estimated acreage that is equipped for irrigation and that was irrigated previously, but not in the survey year. An adequately producing well for ground-water irrigation use, or turnouts and other required facilities for surface water use, were considered minimal facilities to qualify acreage for this item.

## **Results**

### **General**

Texas irrigated acreage increased from 6.7 million acres in 1958 to 7.7 million acres in 1964, to 8 million acres in 1969, to 8.6 million acres in 1974, and then decreased to 7.8 million acres in 1979, to 6.7 million acres in 1984, and to 6.1 million acres in 1989. In 1994, acreage increased slightly to 6.31 million acres followed by a slight increase to 6.35 million acres in the year 2000.

Ground water (only) was used for irrigating about 86 percent of the land irrigated in 2000, 11.6 percent of the acreage was irrigated from surface water (only) supplies, and 2.4 percent from mixed supplies of ground and surface water.

Irrigation water use increased from 9.6 million acre-feet in 1958 to 12.5 million in 1964. From 1964, however, water use decreased somewhat despite a large gain in irrigated acreage, and in 1969 was 11.6 million acre-feet, a reduction of 0.9 million acre-feet from 1964. The total water used in 1974 on irrigated crops was 13.1 million acre-feet, a 13 percent increase since 1969.

While 1964 was abnormally dry, 1958 and 1969 were relatively wet years. The total water used in 1979 on irrigated crops was 9.7 million acre-feet, a 26 percent decrease from 1974. The total water used in 1984 on irrigated crops was 9.3 million acre-feet, a 5 percent decrease from 1979.

The total water used in 1989 on irrigated crops was 8.8 million acre-feet, a 6 percent decrease from 1984, a reduction of 500,000 acre-feet. Nineteen eighty-nine (1989) was a dry year with near average precipitation the first six months, and very dry the last six months in most areas of the State.

In 1994, water use was 10.1 million acre-feet, an increase in water use due to increased acreage and a dry year in most of the Texas High Plains.

In 2000, water use decreased from 10.1 million acres-feet in 1994 to 9.8 million acre-feet.

Water use per acre irrigated in 2000 was 1.54 acre-feet per acre; 1994 was 1.61 acre-feet per acre; 1989 was 1.45 acre-feet per acre; it was 1.38 acre-feet per acre in 1984; 1.24 acre-feet in 1979; 1.52 acre-feet per acre in 1974; 1.41 acre-feet in 1969; 1.62 acre-feet per acre in 1964; and 1.43 acre-feet per acre in 1958.

Irrigation wells have increased in number even though some of the old well casings have deteriorated and wells have been abandoned. There were 115,857 wells in 2000; 107,500 wells in 1994; 100,000 wells in 1989; 100,000 wells in 1984; 95,000 wells in 1979; 90,000 wells in 1974; 83,000 wells in 1969; 70,000 wells in 1964; and 55,000 wells in 1958. Not all of these wells were necessarily used in the survey year referenced although all were considered operable during that year.

Most irrigators in the State are aware of the critical importance of their water supplies. Since total ground-water use constituted 81 percent of the on-farm water use for irrigation in the State in the year 2000, the diminution of this resource is a threat to Texas' agricultural economy and will ultimately have an adverse effect on the overall economy of the State and the Nation.

Many irrigators faced with dwindling water supplies have tried to compensate by using less water per acre – in effect, stretching the water over more acres than the supply will irrigate fully. Using irrigation methods such as those listed on page 8, they are able to produce satisfactory levels of crop yields with less water.

### Irrigated Crops

Acreage of irrigated crops decreased slightly in the State in 2000. There were 8.8 million acres in 1974; 8.1 million acres in 1979; 6.9 million acres in 1984; 6.3 million acres in 1989; 6.7 million acres in 1994; and 6.4 million acres in 2000. The difference in acreage between the acreage irrigated and the irrigated crop acreage results from double cropping – growing two or more crops on the same acre during the survey year. Double cropping was done on 144,868 acres in 2000, which was 209,199 acres less than 1994.

The following tabulation shows that the irrigated acreage of grain sorghum has trended downward since 1974. Wheat and corn each accounted for 15 percent of the 2000 irrigated acreage. Cotton is still the leading crop in 2000. Most irrigated cotton acreage is located in the Southern High Plains. Many acres of grain sorghum have been replaced with cotton and corn. Irrigated cotton acreage has increased in many parts of the State, including the High Plains and El Paso areas.

*Percentages of Total Acreage of Irrigated Crops*

	1974	1979	1984	1989	1994	2000
Grain Sorghum	28	16	15	13	9	5
Cotton	24	28	31	29	33	37
Pasture, Hay, and Other Feed	11	8	9	10	8	10

Vegetables	3	3	3	4	4	4
Rice	6	7	6	5	5	3
Corn	8	12	11	13	16	15
All Other	6	11	8	11	9	11
Total	100	100	100	100	100	100

## **Land Resources for Irrigation**

The kinds, amounts and locations of the soils physically suitable for irrigation in Texas have been determined from completed soil surveys, conservation needs inventories, and irrigation surveys. Data from these studies show that about 38 million acres of land in the State are physically suitable for irrigation, although much of this acreage does not have water available for irrigation use. The 38 million acres include the presently irrigated land.

The acreage of land previously irrigated and still equipped for irrigation, but not irrigated in 2000, was obtained during the field survey. By definition, this is land having at least an adequately producing well for ground-water use, or minimum turnouts and other facilities of using surface water, or both. Approximately 1.7 million acres were recorded in this category, in addition to the 6.36 million acres irrigated in 2000. All of this acreage is readily available for future irrigation. Much of the previously irrigated land is in the rice producing area of the Coastal Prairie where rice, soybeans, and grass are rotated with 1 or 2 years of rice and 1 or 2 years of soybeans or grass, though only rice would be irrigated.

The number of irrigated operating units in 2000 was 35,305. Based on the acreage irrigated and the number of operating units, 180 acres were irrigated per operating unit in 2000, compared with 167 acres per unit in 1994.

Urban development continues to expand onto irrigable land, especially in the Houston-Galveston area, El Paso area, and San Antonio area, and in the suburbs of smaller cities. In the Lower Rio Grande Valley, large blocks of formerly irrigated land have been converted to urban use.

## **Conservation Measures**

Declining ground-water supplies, rising costs of pumping, and limited supplies of surface water are requiring that irrigation water-use efficiency be increased to the fullest extent feasible. The purposes of agricultural water conservation are to allow existing, but exhaustible, ground-water reserves to support present irrigated acreage for longer periods of time, to reduce the costs of production, and, to the extent possible, allow for an increase in irrigated agriculture to meet growing market demands for food and fiber in future decades.

Significant savings in water use can be accomplished with improvements in conveyance systems, the use of more efficient irrigation application systems, soil moisture monitoring, the development and use of drought tolerant strains and varieties of crops and the use of growth regulators and evaporation suppressants. Along with the use of water-saving equipment practices to reduce the quantities of irrigation water applied to crops, appropriate farming practices need to be developed and used to capture and hold rainfall in the soil profile. The capture and retention in the soil profile of rainfall, or reducing runoff from fields, applies beneficially to dryland farming operations as well as to irrigation operations. Furrow diking and conservation tillage are the leading practices currently in use to reduce rainwater runoff, along with control of weeds and brush that use water for no beneficial purposes. In order to realize these potentials, public and private agencies, institutions, and establishments are trying to expand water conservation research and extension programs.

In a properly planned and well-managed irrigation system, all necessary equipment and control structures are installed, the quantity of water used for each irrigation is determined by the need of the crop (especially the stage of growth), and the water-holding capacity of the soil is determined. Water then is applied at a rate and in such a manner that the crops are able to use it efficiently and significant soil erosion does not occur. An important activity has been in the area of assisting irrigators to evaluate the efficiency of their irrigation systems. This helps the irrigator use water more efficiently (less waste) and also cuts down on fuel costs.

Furrow diking is a method of mechanically mounding soil in furrows at selected intervals perpendicular to the farming direction, forming a series of micro dams and water-holding basins. This practice applies beneficially to both irrigated and dryland farming.

Surge flow irrigation is a method of furrow (and basin) irrigation that capitalizes on a natural, soil physical phenomenon. It entails irrigation with two sets of gated pipe, switching water back and forth between these sets. During the off period of the cycle, the water that was in the furrow infiltrates into the soil. This infiltration action creates a surface sealing effect that reduces subsequent infiltration. This infiltration rate reduction helps to lower deep percolation loss at the top of fields.

The Low Energy Precision Application (LEPA) system involves a center pivot sprinkler (although it can be used on a linear move) that has been nozzled for low-energy application. Water is discharged at low pressure right into furrows, which run in concentric circles. The furrows are also furrow diked. The idea behind the system is to eliminate as much evaporation loss as possible. In essence, it has some of the attributes of center pivot, furrow, and trickle irrigation. The furrow dikes keep the water and prevent uniformity imbalances arising from water running off higher elevations into lower areas. Application efficiency of 98 percent is possible. This high efficiency is also coupled with less energy use when compared with the traditional center pivot.

Drip irrigation is the process of delivering precise amounts of water and nutrients directly to the plant's root zone, drop by drop, offering growers exact irrigation control and efficient use of limited water resources. A flat tape or hose can be placed subsurface or on-surface exactly where you want to irrigate.

Within the TWDB's current interagency consensus "Texas Water Plan" process, irrigation water conservation is included in the "most likely" scenario of projected water demands. The methodology assumes moderate adoption of more efficient irrigation technology for areas of the state using groundwater and enhanced conveyance efficiency in areas supplied by surface water distribution systems. Over the 1990 – 2050 projection period, irrigation water use is projected to decline about 20 percent because of conservation practices, declining water levels and other factors making farming no longer feasible in many areas.

Table 1 --- Irrigation Summary for Counties - 1958, 1964, 1969, 1974, 1979, 1984, 1989, 1994 and 2000

COUNTY	YEAR	All Irrigation (On-Farm Use)		Surface Water Supplied (On Farm Use)		Ground Water Supplied (On Farm Use)		Irrigation Using Combined Supplies (On Farm Use)		Surface Source	Irrigation Wells	Sprinkler Systems

## Legend

- Less than 1,000 acres
- 1,000 to 5,000 acres
- 5,000 to 50,000 acres
- 50,000 to 100,000 acres
- Over 100,000 acres

Figure 2  
Distribution of Irrigated Acreage  
by Counties, 2000
